

Name: Ahlam Hani.

Project: Recycle website.

Goal of project:

- Save environment.
- Reduce air pollution.
- Save the money.
- Increase awareness in Jordan.
- Recycle rubbish material.

Description & Main features:

This website built to recycle specific materials (“carton”, “Plastic”). Users can submit a request of material and detect type and quantity. After that that admin accepted the request and add the points depend on quantity and type.

Users can take a journey in my website after create an account and enter required information (“Name”, “Email”, “Password”, “Phone Number”, “location”). There are four option in front of user :

- Offers page: show the offers which related to our stakeholders (“Restaurants”, “Saloon”, “Cinema”, “club” and etc.), user can choose any offer depends on amount of his points. Then add to char.
- Store Page: this page shows products which is made from rubbish materials.
- User information: show user profile.

- Landing Page: includes brief to our website, coat about recycle, number of users, number of stakeholders and quantity of all materials.

There is Admin Dashboard to show all users and add point to each one.

Technologies:

- Html.
- CSS.
- Bootstrap.
- Express.
- React.
- Nodejs.
- MongoDB.
- JQ.

Conclusion:

You earn points. Us earn money. Factories obtained the materials in an easy way. Stakeholders earn advertising and fame.
